TITLE

IMIDAZOPYRIMIDINES AND IMIDAZOPYRIDINES FOR THE TREATMENT OF NEUROLOGICAL DISORDERS

FIELD OF THE INVENTION

The present invention relates to novel compounds, compositions, and methods for the treatment of psychiatric disorders and neurological diseases, including major depression, anxiety-related disorders, post-traumatic stress disorder, supranuclear palsy and feeding disorders, as well as treatment of immunological, cardiovascular or heart-related diseases and colonic hypersensitivity associated with psychopathological disturbance and stress. In particular, the present invention relates to novel imidazopyrimidines and imidazopyridines, pharmaceutical compositions containing such compounds and their use in treating psychiatric disorders, neurological diseases, immunological, cardiovascular or heart-related diseases and colonic hypersensitivity associated with psychopathological disturbance and stress.

BACKGROUND OF THE INVENTION

Corticotropin releasing factor (herein referred to as CRF), a 41 amino acid peptide, is the primary physiological regulator of proopiomelanocortin (POMC) -derived peptide secretion from the anterior pituitary gland [J. Rivier et al., *Proc. Nat. Acad. Sci. (USA)* 80:4851 (**1983**); W. Vale et al., *Science* 213:1394 (**1981**)]. In addition to its endocrine role at the pituitary gland, immunohistochemical localization of CRF has demonstrated that the hormone has a broad extrahypothalamic distribution in the central nervous system and produces a wide spectrum of autonomic, electrophysiological and behavioral effects consistent with a neurotransmitter or neuromodulator role in brain [W. Vale et al., *Rec. Prog. Horm. Res.* 39:245 (**1983**); G.F. Koob, *Persp. Behav. Med.* 2:39 (**1985**); E.B. De Souza et al., *J. Neurosci.* 5:3189 (**1985**)]. There is also evidence that CRF

plays a significant role in integrating the response of the immune system to physiological, psychological, and immunological stressors [J.E. Blalock, *Physiological Reviews* 69:1 (**1989**); J.E. Morley, *Life Sci.* 41:527 (**1987**)].

Clinical data provide evidence that CRF has a role in psychiatric disorders and neurological diseases including depression, anxiety-related disorders and feeding disorders. A role for CRF has also been postulated in the etiology and pathophysiology of Alzheimer's disease, Parkinson's disease, Huntington's disease, progressive supranuclear palsy and amyotrophic lateral sclerosis as they relate to the dysfunction of CRF neurons in the central nervous system [for review see E.B. De Souza, *Hosp. Practice* 23:59 (**1988**)].

In affective disorder, or major depression, the concentration of CRF is significantly increased in the cerebral spinal fluid (CSF) of drug-free individuals [C.B. Nemeroff et al., *Science* 226:1342 (**1984**); C.M. Banki et al., *Am. J. Psychiatry* 144:873 (**1987**); R.D. France et al., *Biol. Psychiatry* 28:86 (**1988**); M. Arato et al., *Biol Psychiatry* 25:355 (**1989**)]. Furthermore, the density of CRF receptors is significantly decreased in the frontal cortex of suicide victims, consistent with a hypersecretion of CRF [C.B. Nemeroff et al., *Arch. Gen. Psychiatry* 45:577 (**1988**)]. In addition, there is a blunted adrenocorticotropin (ACTH) response to CRF (i.v. administered) observed in depressed patients [P.W. Gold et al., *Am J. Psychiatry* 141:619 (**1984**); F. Holsboer et al., *Psychoneuroendocrinology* 9:147 (**1984**); P.W. Gold et al., *New Eng. J. Med.* 314:1129 (**1986**)]. Preclinical studies in rats and non-human primates provide additional support for the hypothesis that hypersecretion of CRF may be involved in the symptoms seen in human depression [R.M. Sapolsky, *Arch. Gen. Psychiatry* 46:1047 (**1989**)]. There is preliminary evidence that tricyclic antidepressants can alter CRF levels and thus modulate the numbers of CRF receptors in

brain [Grigoriadis et al., *Neuropsychopharmacology* 2:53 (**1989**)].

It has also been postulated that CRF has a role in the etiology of anxiety-related disorders. CRF produces anxiogenic effects in animals and interactions between benzodiazepine / non-benzodiazepine anxiolytics and CRF have been demonstrated in a variety of behavioral anxiety models [D.R. Britton et al., *Life Sci.* 31:363 (**1982**); C.W. Berridge and A.J. Dunn *Regul. Peptides* 16:83 (**1986**)]. Preliminary studies using the putative CRF receptor antagonist a-helical ovine CRF (9-41) in a variety of behavioral paradigms demonstrate that the antagonist produces "anxiolytic-like" effects that are qualitatively similar to the benzodiazepines [C.W. Berridge and A.J. Dunn *Horm. Behav.* 21:393 (**1987**), *Brain Research Reviews* 15:71 (**1990**)].

Neurochemical, endocrine and receptor binding studies have all demonstrated interactions between CRF and benzodiazepine anxiolytics, providing further evidence for the involvement of CRF in these disorders. Chlordiazepoxide attenuates the "anxiogenic" effects of CRF in both the conflict test [K.T. Britton et al., *Psychopharmacology* 86:170 (**1985**); K.T. Britton et al., *Psychopharmacology* 94:306 (**1988**)] and in the acoustic startle test [N.R. Swerdlow et al., *Psychopharmacology* 88:147 (**1986**)] in rats. The benzodiazepine receptor antagonist (Ro15-1788), which was without behavioral activity alone in the operant conflict test, reversed the effects of CRF in a dose-dependent manner while the benzodiazepine inverse agonist (FG7142) enhanced the actions of CRF [K.T. Britton et al., *Psychopharmacology* 94:306 (**1988**)].

It has been further postulated that CRF has a role in immunological, cardiovascular or heart-related diseases such as hypertension, tachycardia and congestive heart failure, stroke, osteoporosis, premature birth, psychosocial dwarfism, stress-induced fever, ulcer, diarrhea, post-operative ileus and colonic hypersensitivity associated with psychopathological disturbance and stress.

The mechanisms and sites of action through which the standard anxiolytics and antidepressants produce their therapeutic effects remain to be elucidated. It has been hypothesized however, that they are involved in the suppression of the CRF hypersecretion that is observed in these disorders. Of particular interest is that preliminary studies examining the effects of a CRF receptor antagonist (a-helical CRF9-41) in a variety of behavioral paradigms have demonstrated that the CRF antagonist produces "anxiolytic-like" effects qualitatively similar to the benzodiazepines [for review see G.F. Koob and K.T. Britton, In: *Corticotropin-Releasing Factor: Basic and Clinical Studies of a Neuropeptide*, E.B. De Souza and C.B. Nemeroff eds., CRC Press p221 (1990)].

where: V is CR^{1a} or N; Z is CR^2 or N; A is CR^30 or N; and D is CR^{28} or N.

Many compounds of this invention have one or more asymmetric centers or planes. Unless otherwise indicated, all chiral (enantiomeric and diastereomeric) and racemic forms are included in the present invention. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds, and all such stable isomers are contemplated in the present invention. The compounds may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis from optically active starting materials. All chiral, (enantiomeric and diastereomeric) and racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomer form is specifically indicated.

The term "alkyl" includes both branched and straight-chain alkyl having the specified number of carbon atoms. "Alkenyl" includes hydrocarbon chains of either a straight or branched configuration and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl, propenyl, and the like. "Alkynyl" includes hydrocarbon chains of either a straight or branched configuration and one or more triple carbon-carbon bonds which may occur in any stable point along the chain, such as ethynyl, propynyl and the like. "Haloalkyl" is intended to include both branched and straight-chain alkyl having the specified number of carbon atoms, substituted with 1 or more halogen; "alkoxy" represents an alkyl group of indicated number of carbon atoms attached through an oxygen bridge; "cycloalkyl" is intended to include saturated ring groups, including mono-,bi- or poly-cyclic ring systems, such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, and so forth. "Halo" or "halogen" includes fluoro, chloro, bromo, and iodo.

The term "substituted", as used herein, means that one or more hydrogen on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substitent is keto (i.e., =O), then 2 hydrogens on the atom are replaced.

Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By "stable compound" or "stable structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The term "pharmaceutically acceptable salts" includes acid or base salts of the compounds of formulas (I) and (II). Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic

salts of acidic residues such as carboxylic acids; and the like.

Pharmaceutically acceptable salts of the compounds of the invention can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, PA, 1985, p. 1418, the disclosure of which is hereby incorporated by reference.

"Prodrugs" are considered to be any covalently bonded carriers which release the active parent drug of formula (I) or (II) *in vivo* when such prodrug is administered to a mammalian subject. Prodrugs of the compounds of formula (I) and (II) are prepared by modifying functional groups present in the compounds in such a way that the modifications are cleaved, either in routine manipulation or *in vivo*, to the parent compounds. Prodrugs include compounds wherein hydroxy, amine, or sulfhydryl groups are bonded to any group that, when administered to a mammalian subject, cleaves to form a free hydroxyl, amino, or sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of formulas (I) and (II); and the like.

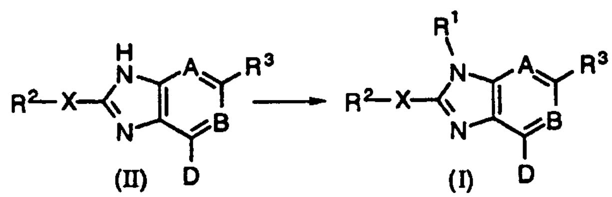
The term "therapeutically effective amount" of a compound of this invention means an amount effective to antagonize abnormal level of CRF or treat the symptoms of affective disorder, anxiety, depression, immunological, cardiovascular or heart-related diseases and colonic hypersensitivity associated with psychopathological disturbance and stress in a host.

Synthesis

Compounds of formula (I) can be prepared by the following synthetic routes and schemes. Where a detailed description is not provided, it is assumed that those skilled in the art of organic synthesis will readily understand the meaning.

Synthesis of compounds of formula (I) may be prepared by the reaction shown in Scheme 1.

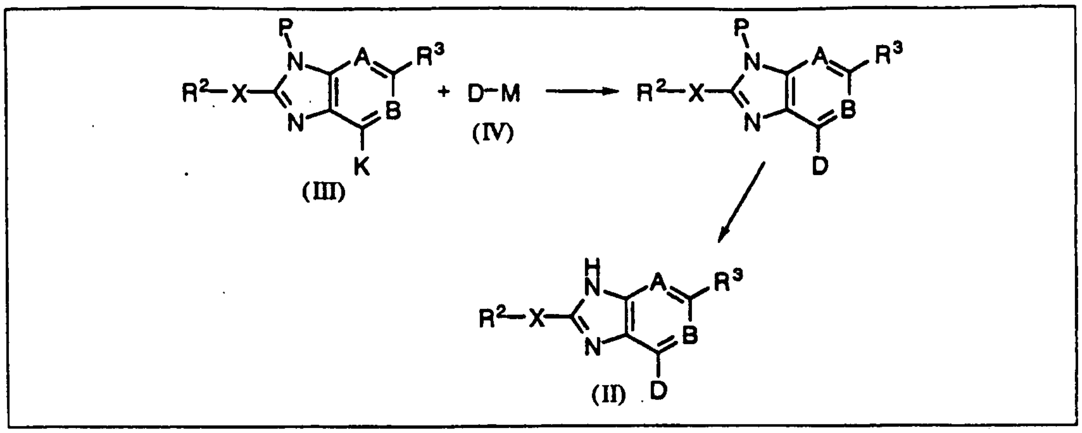
Scheme 1



A compound of formula (II) can be alkylated on the imidazole nitrogen atom with an appropriate reagent. Typical conditions for this transformation include treatment of compound (II) with a base, such as sodium hydride, potassium *tert*-butoxide, sodium hexamethyldisilazide, etc., followed by a reagent J-R^1, where J represents a halide (chloride, bromide or iodide) or psuedohalide (tosylate, mesylate, triflate, etc.), at an appropriate temperature (0 °C or room temperature, with warming if necessary) in a solvent such as tetrahydrofuran, dimethylformamide or dimethylsulfoxide. Alternatively, this reaction may be performed using the Mitsunobu conditions (Mitsunobu, *Synthesis* **1981**, pp. 1-28).The compound (II) is treated with an alcohol compound R^1OH, along with a phosphine (triphenyl, tributyl, etc.) and a phosphine-activating reagent such as diethyl azodicarboxylate.

Compounds of Formula (II) may be prepared according to the route shown in Scheme 2.

Scheme 2

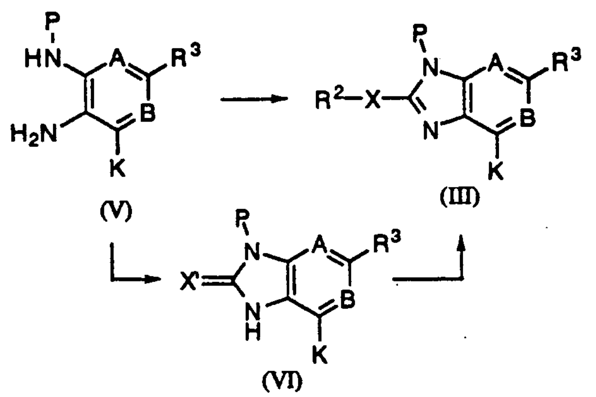


A compound of Formula (III) may be coupled to an aromatic compound of Formula (IV), with elimination of the elements of M-K. For compound (III), K represents a halide, psuedohalide (such as mesylate, tosylate or triflate), or thiomethyl, and P represents a protecting group (if the conditions of the reaction warrant protection of the imidazole N-H; otherwise, P can be H). Suitable P groups may include benzyl, 4-methoxybenzyl, methoxymethyl, trimethylsilylethoxymethyl, *tert*-butoxycarbonyl or benzyloxycarbonyl. For compound (IV), M represents groups such as lithium, bromomagnesium, chlorozinc, (dihydroxy)boron, (dialkoxy)boron, trialkylstannyl and the like. The coupling reaction may be performed in the presence of an appropriate catalyst, such as tetrakis(triphenylphosphine)palladium, bis(triphenylphosphine)palladium dichloride, [1,3-bis(diphenylphosphino)propane]nickel dichloride, etc. Two particularly useful methods involve the coupling of chloroheterocycles with *in-situ*-prepared arylzinc reagents according to the method of Negishi et al. (*J. Org. Chem.* **1977**, *42*, 1821), and the coupling with arylboronic esters according to the method of Suzuki et al. (*Chem. Letters* **1989**, 1405). Appropriate solvents for reactions of this type usually include tetrahydrofuran, diethyl ether, dimethylformamide, or dimethylsulfoxide. Typical temperatures range from ambient up to the boiling point of the solvent. Once coupled, the P group may be removed to afford compound (II). Conditions for the removal of the protecting groups are well known to those familiar to the art of organic synthesis; e.g. hydrogenation

to remove benzyl or benzyloxycarbonyl, a fluoride source (such as tetrabutylammonium fluoride) to remove silylethoxymethyl, an acid source (such as trifluoroacetic acid) to remove *tert*-butoxycarbonyl or 4-methoxybenzyl, etc.

Compounds of formula (III) can be prepared according to the plan shown in Scheme 3.

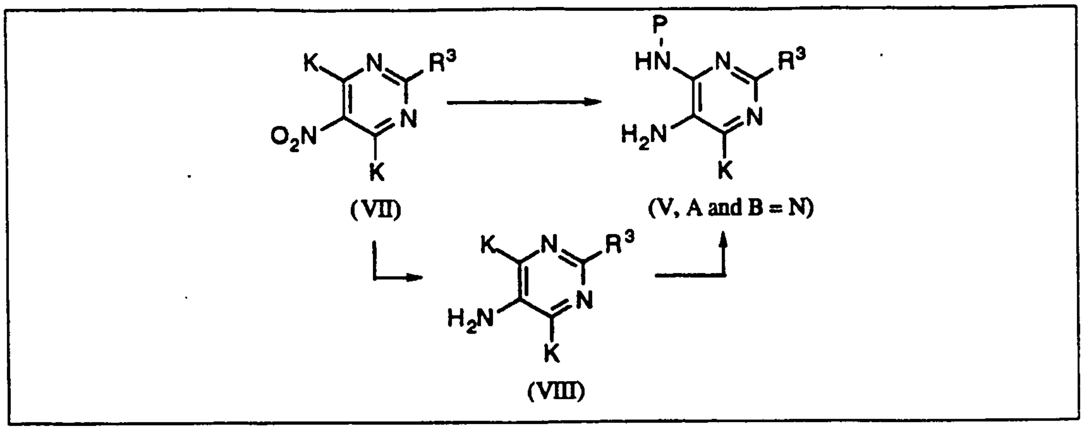
Scheme 3



A diamine compound of formula (V) (in this case, P is a group such as benzyl, which can be introduced already attached to the nitrogen atom; otherwise, P could represent H initially, and another protecting group being introduced in a later step) is used in a cyclocondensation reaction to make the imidazole ring. The conditions used will, of course, depend on the X group chosen, and may include the intermediacy of the compound (VI). A review of imidazole-forming reactions may be found in *Comprehensive Heterocyclic Chemistry* (Pergamon Press, 1984) vol. 5, pp. 457-498.

Preparation of compounds of formula (V) wherein both A and B are nitrogen atoms may proceed according to the route of Scheme 4.

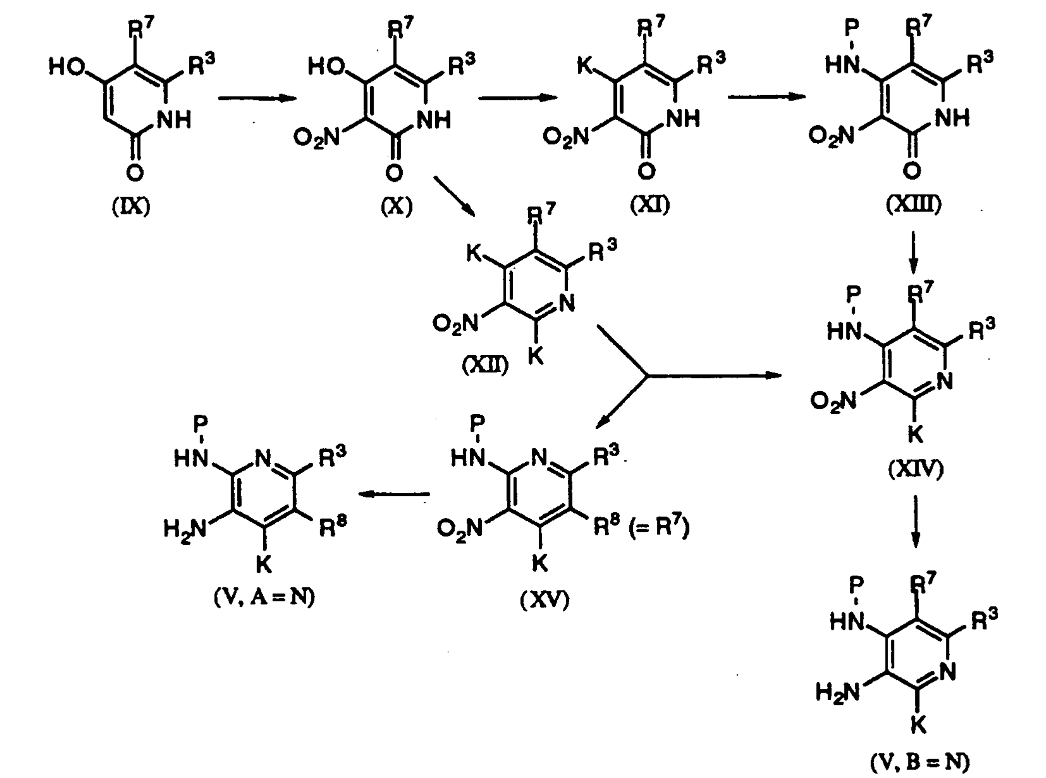
Scheme 4



A compound of formula (VII) may be available from commercial sources, particularly for K = chloride. Compounds bearing psuedohalide K groups may be available from the corresponding dihydroxy compounds by treatment with an appropriate activating reagent, such as an organosulfonic anhydride or sulfonyl chloride. Compound (VII) may be converted to (V) by either (i) monoalkylation with a compound P-NH_2, followed by reduction of the nitro group; (ii) reduction of the nitro group, to give an amine compound of formula (VIII), followed by monoalkylation with a compound P-NH_2; or (iii) use of a source of ammonia (ammonia gas, ammonium hydroxide, etc.) in either route, followed by protection of the amine group with the group P. Pyrimidine chemistry of this type is well represented in the literature, and is reviewed in *Comprehensive Heterocyclic Chemistry*, vol. 6. Alkylation of chloropyrimidines with amine compounds can be accomplished under either acidic (e.g. HCl or acetic) or basic (trialkylamines, potassium *tert*-butoxide, etc.) conditions. Nitro groups in compounds of this type can be reduced to amino groups using one of any number of conditions, including catalytic hydrogenation, tin dichloride, sodium dithionite, zinc metal, iron powder, etc.

Preparation of compounds of formula (V) wherein either A or B represent nitrogen atoms is shown in Scheme 5.

Scheme 5

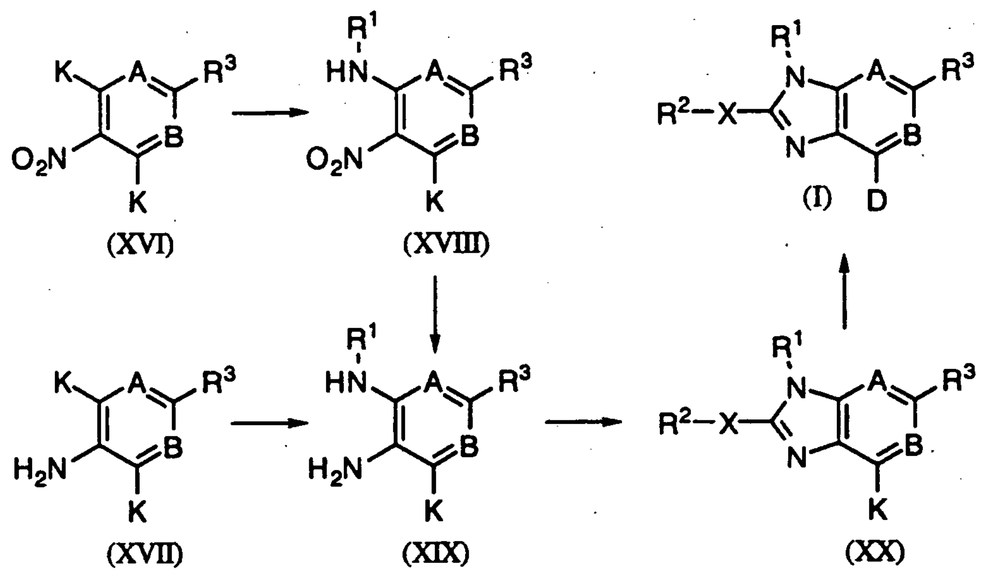


An hydroxypyridone compound of formula (IX) can be nitrated to give compound (X) employing conditions such as concentrated or fuming nitric acid, optionally in the presence of concentrated sulfuric or acetic acid. The hydroxypyridone can be selectively monoactivated with a K group to give a compound of formula (XI); one method to do this involves treatment of the dicyclohexylamine salt of compound (X) with phosphorus oxychloride to give (XI) wherein K = Cl. Alternatively, both the hydroxy and pyridone groups in compound (X) can be activated at the same time, using stronger conditions such as phosphorus oxychloride and heat, or excess toluenesulfonic anhydride, to give compound (XII). Compound (XI) may be converted to the protected amine compound (XIII) using the same general route discussed above for the pyrimidines.

Selective monoalkylation using compound (XII) is also possible, but will probably give mixtures of regioisomeric products (XIV) and (XV). The nitro groups in these compounds can then be reduced as discussed above, to give compounds for formula (V) wherein either A or B is nitrogen.

An alternative approach to the method involving introduction of the R^1 group at the initial step is shown in Scheme 6.

Scheme 6

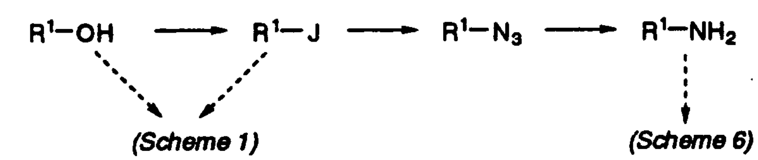


This is particularly useful in the cases where R^1 represents a group where alkylation of compound (II) is impractical (e.g. a very bulky R^1 group), but can also be used in a general manner. Here, compounds of formula (XVI) or (XVII) (either amino- or nitro-pyridines or pyrimidines) are alkylated with an amine reagent R^1-NH_2, under either acidic or basic conditions as described above. Nitro compound (XVIII) can be converted to amine compound (XIX) by nitro reduction reactions described earlier. Compound (XIX) can be cyclized to imidazole compound (XX). As above, this reaction will depend upon the choice of X group. For example, for X = CHR^9, one can use an orthoester reagent such as $R^2CH(R^9)C(OR)_3$, with heating in neat solution or high-boiling solvents, and the optional presence of an acid catalyst (such as hydrochloric or sulfuric acid) (see

Montgomery and Temple, *J. Org. Chem.* **1960**, *25*, 395). For X = NR^{10}, the cyclization is performed using reagents such as an guanidine reagent of the structure $R^2R^{10}N\text{-}C(=NH)NH_2$ or a urea-derived reagent of the structure $R^2R^{10}N\text{-}C(=NH)D$, where D represents a group like OCH_3, SCH_3 or SO_2CH_3. For X = O, the ring is formed using a reagent of the structure $(R^2O)_4C$ (with acetic acid catalysis), provided one has access to the reagent with the R^2 group of choice (see Brown and Lynn, *J. Chem. Soc. Perkin Trans. I* **1974**, 349). Alternatively, the diamine (XIX) is treated with phosgene, followed by O-alkylation to introduce the R^2 group (such as a reagent like R^2-I or R^2-Br). A similar route can be used for X = S, which would use thiophosgene or some similar reagent, followed by S-alkylation with the R^2 group. The sulfur atom in this compound (and sulfide groups throughout the molecule in general) can be oxidized to either the sulfoxide or sulfone if desired by treatment with an appropriate oxidizing agent such as potassium permanganate, potassium peroxomonosulfate or m-chloroperbenzoic acid. Finally, compound (XX) can be used in an aryl coupling reaction as described above to replace the K group with the desired aryl group in compound (I).

Methods of synthesis of compounds R^1-OH, R^1-J and R^1-NH_2 are related, in that the alcohol can be used in the synthesis of the other two compounds, as is shown in Scheme 7.

Scheme 7

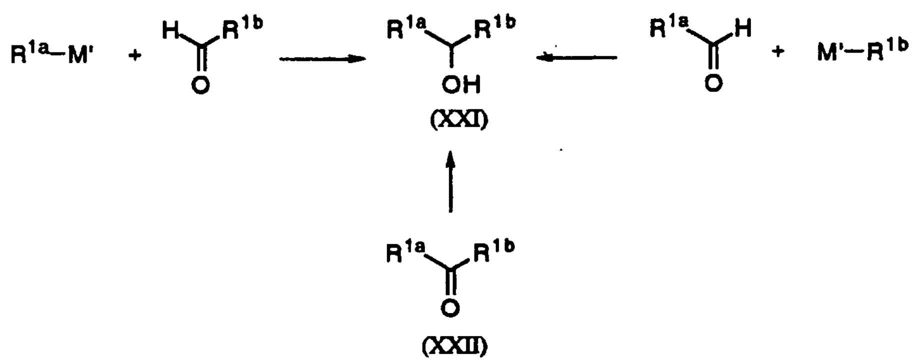


For example, the hydroxy group may be converted to the following J groups, using the indicated reagents (this route is not limited to these J groups): methanesulfonate, using methanesulfonyl chloride or anhydride and an appropriate base; toluenesulfonate, using toluenesulfonyl chloride or anhydride and an appropriate base; iodide; using iodine / triphenylphosphine; bromide, using phosphorus tribromide or

carbon tetrabromide / triphenylphosphine; or trifluoromethanesulfonate, using trifluoromethane-sulfonic anhydride and an appropriate base. Both compounds R^1-OH and R^1-J are used in the methods portrayed in Scheme 1. Conversion of R^1-J to R^1-N_3 requires the use of an azide source, such as sodium azide, and a solvent such as dimethylsulfoxide or dimethylformamide, or water and a phase-transfer catalyst (such as tetrabutylammonium hydrogen sulfate). Reduction of the azide compound R^1-N_3 to R^1-NH_2 may be accomplished using reagents such as sodium borohydride or triphenylphosphine, or hydrogen gas and a catalyst (such as palladium on carbon). The amine R^1-NH_2 may then be employed in the methods portrayed in Scheme 6.

In the cases where the compound R^1-OH could be represented by a structure of formula (XXI) (Scheme 8), wherein R^{1a} and R^{1b} represents substructures which, taken together with the carbinol methine group, comprise the entire group R^1, this compound may be prepared by addition to a carbonyl compound.

Scheme 8

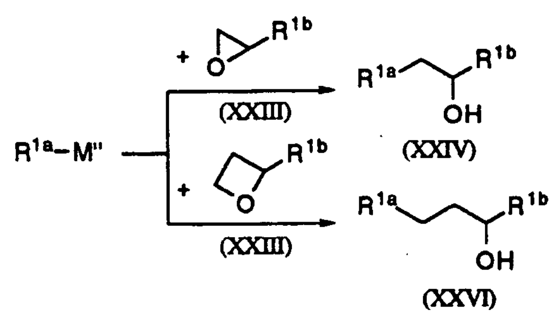


This route is particularly useful in the case where R^{1a} or R^{1b} represents a cycloalkyl group, such as cyclopropyl. An organometallic reagent (where M' represents a metallic group, such as Li, CuCN, CuI, MgCl, MgBr, MgI, ZnCl, CrCl, etc.) can be allowed to react with an aldehyde reagent to prepare the alcohol compound of formula (XXI). Alternatively, a ketone of formula (XXII) may be treated with a reducing agent, such as sodium borohydride, lithium aluminum hydride, etc., which will

also generate the alcohol of formula (XXI). Standard methods of ketone synthesis may be used where appropriate in the preparation of compounds for formula (XXII), which will be familiar to those skilled in the art of organic synthesis.

An homologous approach may also be employed in the synthesis of alcohols R^1-OH, involving the ring-opening reaction of cyclic ether compounds with organometallic reagents (Scheme 9).

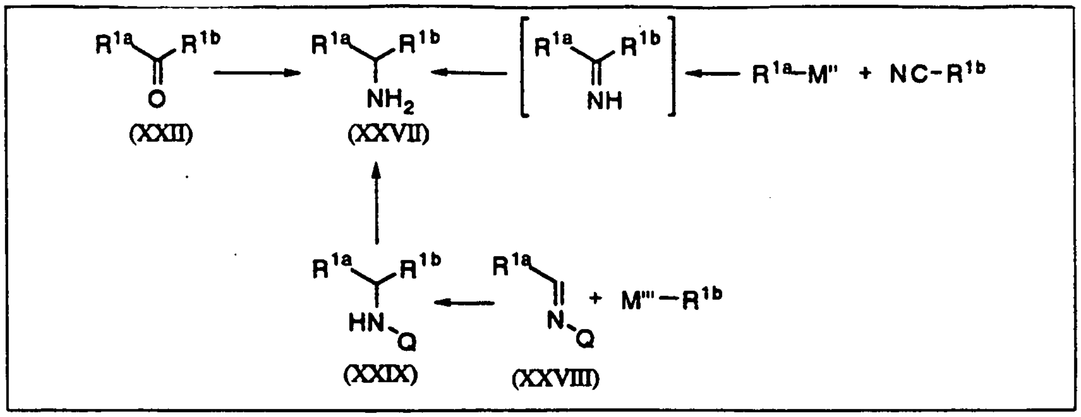
Scheme 9



Here, an organometallic reagent R^{1a}-M" is used, where M" represents metals such as Mg, Zn or Cu. Especially useful is the method described in Huynh, et al., Tetrahedron Letters **1979**, (17), pp. 1503-1506, where organomagnesium reagents are allowed to react with cyclic ethers with catalysis provided by copper (I) iodide. Use of an epoxide compound of formula (XXIII) in this manner would result in synthesis of an alcohol compound of formula (XXIV), and use of an oxetane compound of formula (XXV) would generate an alcohol of formula (XXVI). Both compounds (XXIV) and (XXVI) are variants of R^1-OH.

Synthesis of compound R^1-NH_2 with formula (XXVII) is portrayed in Scheme 10.

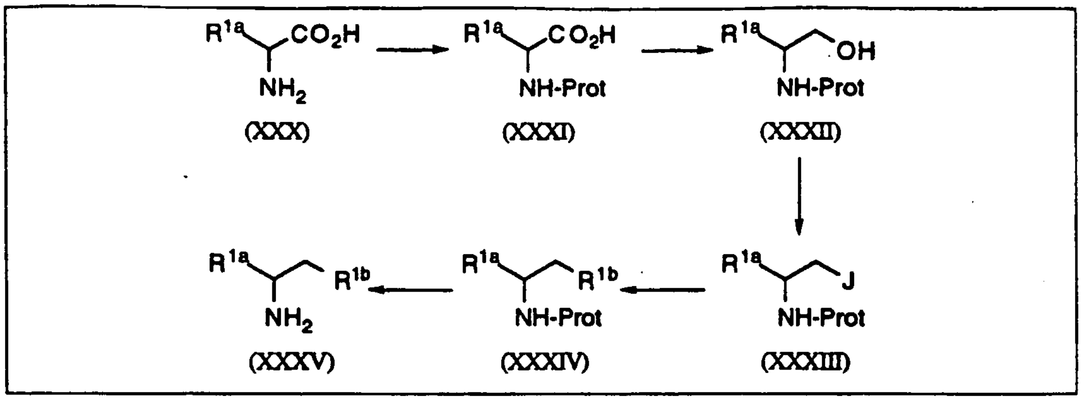
Scheme 10



A simple reductive amination of ketone (XXII) will produce amine (XXVII). This reaction may be performed using anhydrous ammonia in the presence of hydrogen and a catalyst. Alternatively, addition of an organometallic reagent to a nitrile compound gives and imine, which may be treated in situ with a reducing agent (such as sodium cyanoborohydride) to give amine (XXVII). Finally, a compound of formula (XXVIII), wherein Q is an optionally-substituted oxygen atom (i.e. an oxime) or nitrogen atom (i.e. a hydrazone), may be allowed to react with an organometallic reagent R^{1b}-M'''. Here, metallic groups M''' such as MgBr, CuCl or $CeCl_2$ have been used in additions to oximes or hydrazones. The intermediate addition products of formula (XXIX) may be subjected to reductive cleavage (using conditions such as sodium/liquid ammonia or catalytic hydrogenation), which will afford amines (XXVII).

Amino acids, either naturally-occurring or synthetic, are potential sources of useful starting materials for the synthesis of the compounds of this invention. Scheme 11 shows some possible applications of this approach.

Scheme 11

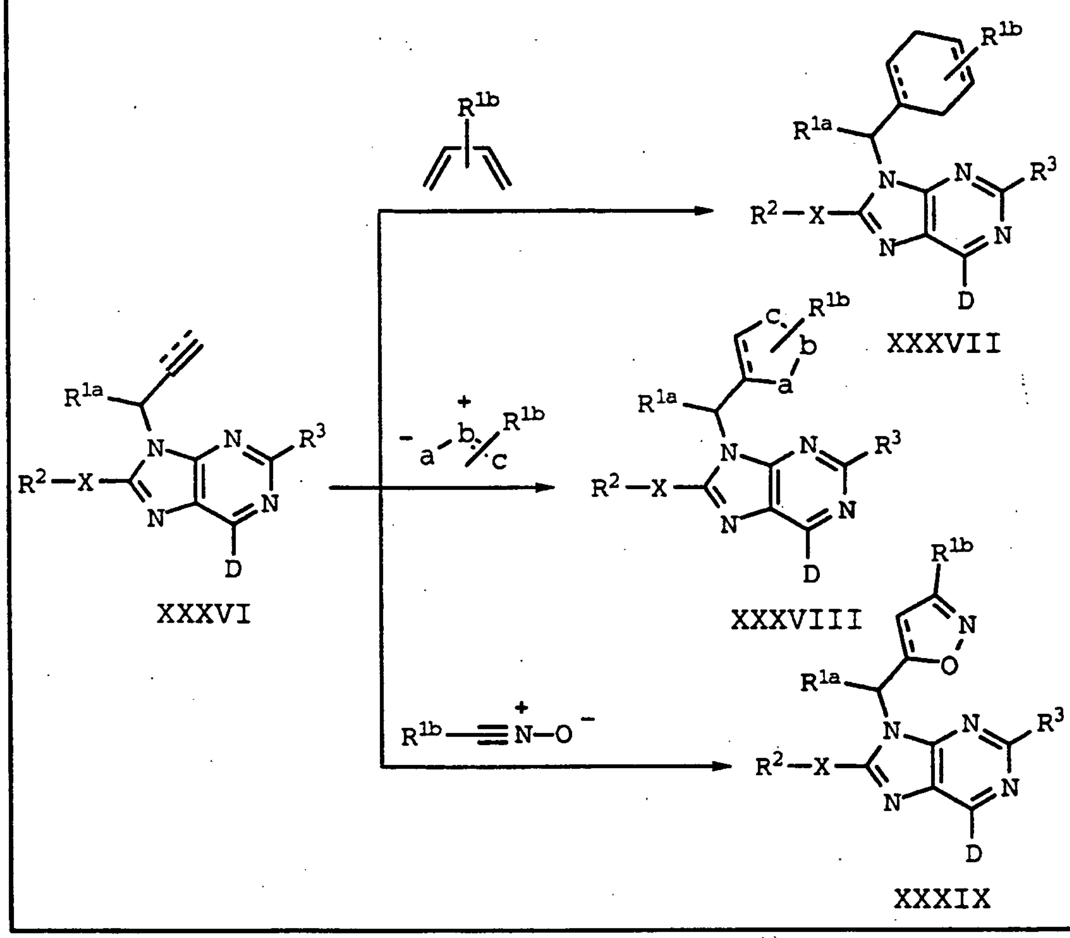


Protected amino acids of formula (XXXI) are prepared from the parent compounds of formula (XXX); useful protecting groups ("Prot") include tert-butoxycarbonyl, benzyloxycarbonyl and triphenylmethyl. Standard texts in peptide chemistry describe this protection. The carboxylic acid group may be reduced using reagents such as lithium borohydride, which gives alcohol (XXXII). The hydroxy group may be converted to a leaving group "J" as described before. The compound of formula (XXXIII) may be treated with appropriate reagents to produce a wide variety of functional groups included in the scope of this invention (compound (XXXIV)); displacement of J with cyanide (sodium cyanide in warm dimethylformamide may be used here) gives a nitrile, displacement of J with a mercaptan (in the presence of a base, such as potassium carbonate) gives a disulfide, displacement of J with a secondary amine gives a tertiary amine, etc.

The compounds of Formula (I) with unsaturated R^1 groups can be a further source of compounds covered under this invention. Unsaturated (double and triple) bonds can take part in cycloaddition chemistry with appropriate reagents (Scheme 12). Cycloaddition of an alkyne compound of Formula XXXVI with 1,3-dienes to give six-membered ring compounds like that of Formula XXXVII (commonly known as the Diels-Alder reaction), and cycloaddition with 3-atom dipolar reagents to give heterocyclic compounds of Formula XXXVIII, are familiar to those skilled in the art of organic synthesis. One specific

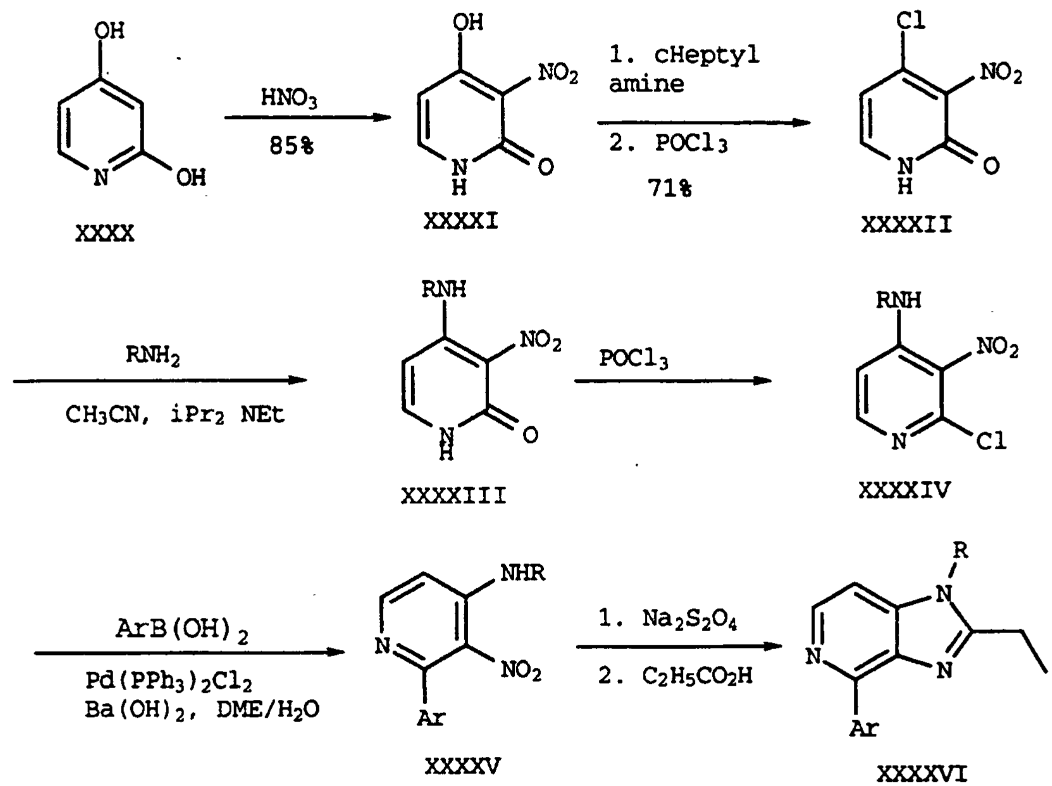
example of this approach is the synthesis of an isoxazole compounds of Formula XXXIX from the alkyne XXXVI and a nitrile oxide reagent.

Scheme 12



The synthetic procedure in Scheme 13 shown below may be used to prepare 4,5-c imidazopyridines.

Scheme 13

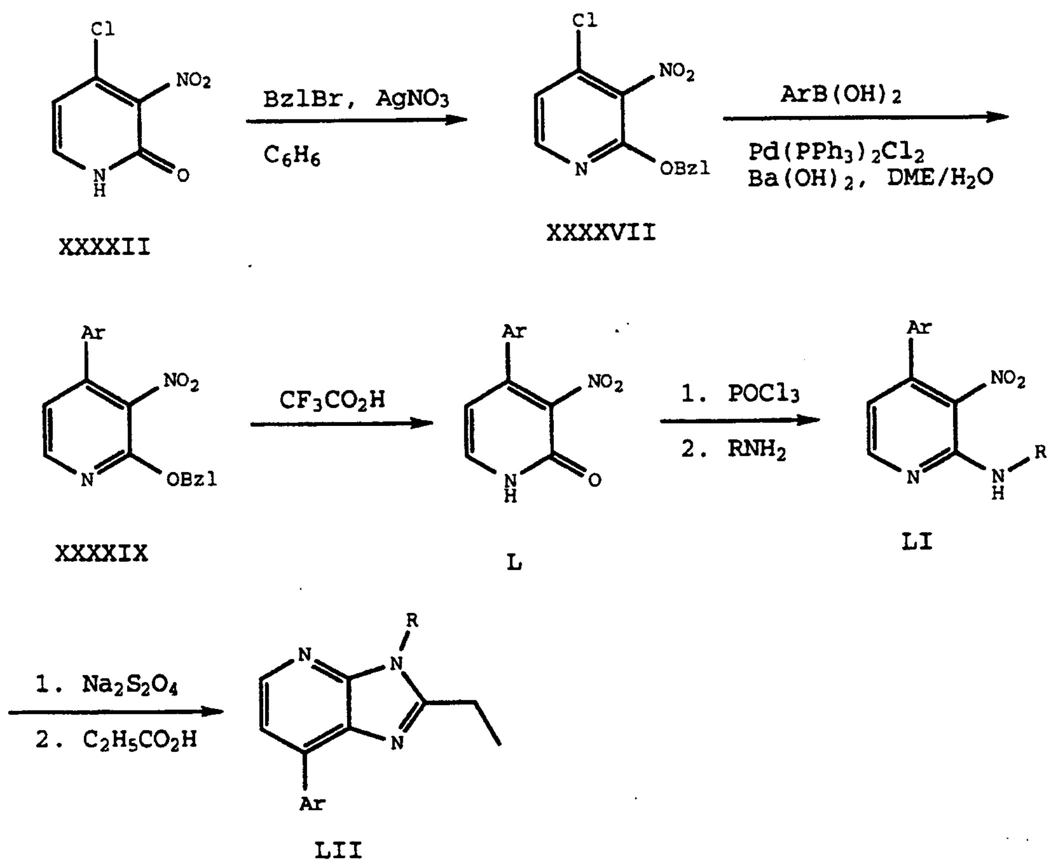


Nitration of 2,4-dihydroxypyridine (XXXX) with HNO_3 as described earlier (Koagel et al. Recl. Trav. Chim. Pays-Bas. 29, 38, 67, **1948**) gave the corresponding 3-nitropyridone (XXXXI) which was treated with an organic amine base, such as cycloheptyl amine to give selectively the corresponding 4-chloropyridone (XXXXIII). This in turn was reacted with a primary amine RNH_2, where R is a group described earlier in an aprotic or protic solvent, such as CH_3CN, DMSO, DMF, or an alkyl alcohol in the presence of an organic or inorganic base, such as a trialkylamine, K_2CO_3, Na_2CO_3 etc, and in temperature range of 20-200 °C to give the 4-amino adduct (XXXXIII). Pyridone (XXXXIII) was converted to the 2-chloropyridine (XXXXIV) by treatment with $POCl_3$, and (XXXXIV) was coupled with an arylboronic acid $ArB(OH)_2$ under palladium catalysis to

give (XXXXV). Nitropyridine (XXXXV) was reduced to the corresponding aminopyridine by use of $Na_2S_2O_4$ or a Fe, Sn or $SnCl_2$ and converted to the imidazo[4,5-c]pyridine in refluxing propionic acid. The same transformation can be affected by the use of a nitrile, an imidate, thioimidate or trialkylorthopropionate.

The synthetic procedure in Scheme 14 shown below may be used to prepare 4,5-b imidazopyridines.

Scheme 14



Reaction of 4-chloropyridone (XXXXII) with an aryl halide, such as benzyl bromide in benzene and in the presence of Ag_2CO_3 as described in Scheme 13 (Smith A. M.; et al. J. Med. Chem.. 36, 8, **1993**) and at temperature ranges of 30-80 °C afforded the corresponding 2-benzyloxypyridine (XXXXVII). This was coupled with an arylboronic acid, $ArB(OH)_2$ under palladium-catalyzed conditions to give (XXXXIX). The benzyloxy group can be removed by treatment with a strong acid, such as trifluoroacetic, triflic, sulfuric, HCl, etc. to give pyridone (L). This was converted to the 2-halopyridine with the action of POX_3, PX_5 or the corresponding triflate, tosylate or mesylate, which was displaced with a primary amine RNH_2 to give (LI). The nitro group was reduced under conditions described in scheme 13 and the aminopyridine was cyclized to the imidazolo[4,5-b]pyridine (LII) under conditions described in scheme 13.

Example 2001

Preparation of 1-benzyl-6-methyl-4-(2,4,6-trimethylphenyl)imidazo[4,5-*c*]pyridine

Part A. A solution of 4-chloro-6-methyl-3-nitropyridone (5.0 g, 26.5 mmol) in acetonitrile (93 mL) was treated with benzylamine (2.89 mL, 26.5 mmol) and diisopropylethylamine (5.54 mL, 31.8 mmol). The mixture was heated to reflux for 4 hrs., then cooled to ambient temperature and allowed to stir for 12 hrs. The mixture was partitioned between dichloromethane and water (200 mL each), and the aqueous layer was extracted with dichloromethane (200 mL). The

extracts were washed in sequence with water (200 mL) and combined, and the resulting precipitate was collected by filtration. The filtrate was dried over sodium sulfate, refiltered and evaporated to afford a second crop of crystalline product, 4-benzylamino-6-methyl-3-nitropyridone (6.74 g total, 26.0 mmol, 98%). m.p. 246-247 °C. TLC R_F 0.35 (10:90 isopropanol-ethyl acetate). ^{1}H NMR (300 MHz, $CDCl_3$): d 10.48 (1H, br s), 9.69 (1H, br s), 7.41-7.26 (5H, m), 5.66 (1H, s), 4.57 (2H, d, J = 5.5 Hz), 2.26 (3H, s). MS (NH_3-CI): *m/e* 261 (10), 260 (70), 226 (100).

Part B. A solution of the pyridone from Part A (6.72 g, 25.9 mmol) in phosphorus oxychloride (52 mL, 25.5 mmol) was stirred at ambient temperature for 3 d. The reaction mixture was poured into a mixture of ice (150 g) and dichloromethane (200 mL). After the ice had melted, 100 mL more dichloromethane was added, and the pH of the mixture was adjusted to 7 with solid $NaHCO_3$. The mixture was separated, and the aqueous phase was extracted with dichloromethane. The extracts were combined, dried over sodium sulfate, filtered and evaporated to afford the product (4-benzylamino-2-chloro-6-methyl-3-nitropyridine) as a bright yellow crystalline solid (6.45 g, 23.2 mmol, 90%). TLC R_F 0.76 (ethyl acetate). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.43-7.26 (5H, m), 7.04 (1H, br), 6.47 (1H, s), 4.48 (2H, d, J = 5.5 Hz), 2.40 (3H, s). MS (NH_3-CI): *m/e* 281 (5), 280 (35), 279 (17), 278 (100).

Part C. A solution of the nitro compound from Part B above (6.42 g, 23.1 mmol) in methanol (162 mL) was treated with iron powder (13.61 g) and glacial acetic acid (13.6 mL). The resulting mixture was heated to reflux for 2 h, then cooled, filtered through celite (with methanol washing) and evaporated. The residual material was taken up in dichloromethane (231 mL) and 1 N aq. HCl (162 mL), and adjusted to neutral pH by addition of solid $NaHCO_3$. This mixture was filtered through celite and separated, and the aqueous phase was extracted with dichloromethane. The

extracts were combined, dried over Na_2SO_4, filtered and evaporated to afford the product, 3-amino-4-benzylamino-2-chloro-6-methylpyridine, as a solid (5.59 g, 22.6 mmol, 98%). m.p. 177-178 °C. TLC R_F 0.60 (ethyl acetate). ^1H NMR (300 MHz, $CDCl_3$): d 7.41-7.32 (5H, m), 6.33 (1H, s), 4.54 (1H, br), 4.36 (2H, d, J = 5.1 Hz), 3.30 (2H, br s), 2.35 (3H, s). MS (NH_3-CI): *m/e* 251 (6), 250 (37), 249 (19), 248 (100).

Part D. A suspension of the diamine from Part C above (2.15 g, 8.68 mmol) in triethyl orthopropionate (5 mL) was treated with conc. HCl (3 drops), and heated to reflux for 1 h, then cooled and the excess orthoester removed by vacuum distillation. The pot residue was taken up in ethyl acetate (120 mL), which was washed with water and brine (100 mL each). The aqueous phases were back-extracted in sequence with ethyl acetate, and the extracts were combined, dried over Na_2SO_4, filtered and evaporated to afford N-(4-benzylamino-2-chloro-6-methylpyridin-3-yl)propionamide O-ethyl imidate (2.62 g, 91%). TLC R_F 0.40 (30:70 ethyl acetate-hexane). ^1H NMR (300 MHz, $CDCl_3$): d 7.39-7.29 (5H, m), 6.29 (1H, s), 4.64 (1H, br t, J = 5.8 Hz), 4.37 (2H, d, J = 5.8 Hz), 4.25 (2H, br), 2.35 (3H, s), 2.18-2.11 (2H, m), 1.36 (3H, t, J = 7.0 Hz), 1.06 (3H, t, J = 7.7 Hz). MS (NH_3-CI): *m/e* 335 (7), 334 (34), 333 (22), 332 (100).

Part E. A solution of the compound from Part D (2.62 g, 7.90 mmol) in phenyl ether (10 mL) was heated to 170 °C for 6 h, then cooled and poured into ethyl acetate (150 mL). This was washed with water and brine (100 mL each), then dried over Na_2SO_4, filtered and evaporated. The residual liquid was separated by column chromatography (hexane, then ethyl acetate) to afford the product, 1-benzyl-4-chloro-2-ethyl-6-methylimidazo[4,5-*c*]pyridine, as an oil (2.16 g, 96 %). m.p. 140-141 °C. TLC R_F 0.06 (30:70 ethyl acetate-hexane). ^1H NMR (300 MHz, $CDCl_3$): d 7.36-7.32 (3H, m), 7.02-6.98 (2H, m), 6.93 (1H, s), 5.31 (2H, s), 2.89 (2H, q, J =

7.3 Hz), 2.58 (3H, s), 1.39 (3H, t, J = 7.3 Hz). MS (NH_3-CI): *m/e* 289 (6), 288 (35), 287 (20), 286 (100).

Part F. A solution of zinc chloride (538 mg) in tetrahydrofuran (7 mL) was treated with a tetrahydrofuran solution of 2-mesitylmagnesium bromide (3.95 mL, 1.0 M), and stirred for 1 h. In another flask, a solution of bis(triphenylphosphine)palladium chloride (93 mg, 0.132 mmol) in tetrahydrofuran (5 mL) was treated with a hexane solution of diisobutylaluminum hydride (0.263 mL, 1.0 M), and this solution was stirred for 20 min. The arylzinc solution was then delivered by cannula to the flask containing the palladium catalyst, which was followed by the chloride prepared in Part E. The mixture was heated to reflux for 12 h, then cooled, and poured into water (100 mL). This was extracted with ethyl acetate (2 x 150 mL), and the extracts were washed with brine, combined, dried over Na_2SO_4, filtered and evaporated. The residual material was separated by column chromatography (1:1 ethyl acetate-hexane) to afford the title product as a solid, recrystallized to purity from ether (187 mg, 29%). m.p. 177-180 °C (ether). TLC R_F 0.27 (50:50 ethyl acetate-hexane). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.38-7.32 (3H, m), 7.10-7.05 (2H, m), 6.96 (1H, s), 6.93 (2H, s), 5.32 (2H, s), 2.84 (2H, q, J = 7.3 Hz), 2.64 (3H, s), 2.30 (3H, s), 2.02 (6H, s), 1.26 (3H, t, J = 7.3 Hz). MS (NH_3-CI): *m/e* 372 (4), 371 (29), 370 (100). Analysis calc'd for $C_{25}H_{27}N_3$: C, 81.26; H, 7.38; N, 11.37; found: C, 80.70; H, 7.26; N, 11.20.

The methods discussed below in the preparation of 3-benzyl-5-methyl-7-(2,4,6-trimethylphenyl)-imidazo[4,5-*b*]pyridine (Example 3001, Table 3) may be used to prepare all of the examples of Structure A contained in Table 3, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

The methods of Schemes 13 and 14 may be used to prepare many of the examples of Structure B and Structure C contained in Table 3, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

Example 3001

Preparation of 3-benzyl-5-methyl-7-(2,4,6-trimethylphenyl)imidazo[4,5-*b*]pyridine

Part A. A solution of 2,4,6-trimethylbenzeneboronic acid in benzene (0.5 M) is treated with excess *n*-butanol, and the solution is heated to reflux under a Dean-Stark still head to azeotropically remove water. Solvent is removed by evaporation, and the resulting dibutyl 2,4,6-trimethylbenzeneboronate is used directly in Part B.

Part B. The method of Snieckus et al. (Fu, J. M.; Zhao, B. P.; Sharp, M. J.; Snieckus, V. *Can. J. Chem.* **1994**, *72*, 227-236) may be employed here. Thus, a solution of 4-chloro-6-methyl-3-nitro-2-pyridone in dimethylformamide (0.1 M) is treated with the boronate from Part A (1.2 eq), tribasic potassium phosphate (2.4 eq), and [1,1'-bis(diphenylphosphino)-ferrocene]dichloropalladium (0.1 eq). The mixture is stirred at ambient temperature for 30 hrs., then poured into 4 volumes ethyl acetate. This is washed with 3 equal volumes of water, then brine. The extract is dried over Na_2SO_4, filtered and evaporated. Chromatographic separation affords pure 6-methyl-3-nitro-4-(2,4,6-trimethylphenyl)-2-pyridone.

Part C. The pyridone from Part B is suspended in 6 eq phosphorus oxychloride, and stirred with mild heating until the compound dissolves. The mixture is cooled, and poured over ice. After melting, the mixture is extracted twice with dichloromethane, and the extracts are combined, dried over Na_2SO_4, filtered and evaporated. The product, 2-chloro-

6-methyl-3-nitro-4-(2,4,6-trimethylphenyl)pyridine, is purified by either chromatography or recrystallization.

Part D. The chloride from Part C is dissolved in ethanol, and treated with benzylamine (1.2 eq.). The mixture is heated to reflux until the starting material is consumed as determined by thin-layer chromatography. The mixture is evaporated, and the residual material is partitioned between water and ethyl acetate. The organic layer is separated, washed with brine, dried over Na_2SO_4, filtered and evaporated. The product, 2-benzylamino-6-methyl-3-nitro-4-(2,4,6-trimethylphenyl)pyridine, is purified by either chromatography or recrystallization.

Part E. The nitro compound from Part D is dissolved in 1:1 aqueous dioxane, and treated with conc. aq. ammonium hydroxide solution. To this is added solid sodium dithionite in several portions over 2 h. The mixture is allowed to stir for an additional 4 h, then partitioned between water and ethyl acetate. The organic layer is separated, washed with brine, dried over Na_2SO_4, filtered and evaporated. The product, 3-amino-2-benzylamino-6-methyl-4-(2,4,6-trimethylphenyl)pyridine, is purified by either chromatography or recrystallization.

Part F. A suspension of the diamine from Part E above in triethyl orthopropionate is treated with conc. HCl, and heated to reflux for 1 h, then cooled and the excess orthoester removed by vacuum distillation. The pot residue contains sufficiently pure N-[2-benzylamino-4-(2,4,6-trimethylphenyl)-6-methylpyridin-3-yl]propionamide O-ethyl imidate.

Part G. A solution of the compound from Part F in phenyl ether is treated with a catalytic amount of p-toluenesulfonic acid and heated to 170 °C for 6 h, then cooled. The residual liquid is separated by column

chromatography (hexane, then ethyl acetate) to afford the title product.

The methods used in the preparation of the compounds of Structure A of Table 1 may be used for the compounds of Structure A of Table 4. For example, replacing variously-substituted pyridine- and pyrimidineboronic acids for benzeneboronic acids in the palladium-catalyzed aryl cross-coupling method (see Examples 35 or 831) will afford the desired 6-pyridyl- or 6-pyrimidylpurine compounds.

The methods of Schemes 13 and 14 may be used to prepare many of the examples of Structure B and Structure C contained in Table 4, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

The methods used in the preparation of the compounds of Table 1 may be employed in the synthesis of those compounds of Structure A in Table 5 and Table 5A. The methods employed to make the analogues bearing a benzofuran group are illustrated in the following examples.

The methods of Schemes 13 and 14 may be used to prepare many of the examples of Structure B and Structure C

contained in Table 5 and Table 5A, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

Example 5001

Preparation of 9-Dicyclopropylmethyl-8-ethyl-6-(6-methyl-2,3-dihydrobenzofuran-5-yl)purine

Part A. Sodium hydride dispersion in mineral oil (5.05 g, 50% w/w, 105 mmol) was washed with hexane and dried under vacuum. DMF (100 mL) was added, the slurry was cooled to 0 °C, and treated with a solution of *m*-cresol (10 mL, 95.6 mmol) in DMF (20 mL). The resulting mixture was allowed to stir for 1 h, then was treated with chloromethyl methyl ether (8.00 mL, 105 mmol) by syringe. The mixture was stirred overnight, then poured into ethyl acetate (200 mL). This was washed with water (3 x 200 mL) and brine (100 mL), and the aqueous phases were back-extracted in sequence with ethyl acetate. The extracts were combined, dried over magnesium sulfate, filtered and evaporated. The oily product was purified by elution through a plug of silica gel with 10:90 ethyl acetate-hexane. Evaporation then afforded the pure product, 3-(methoxymethoxy)toluene, as an oil (13.93 g, 91.5 mmol, 96%). TLC R_F 0.46 (10:90 ethyl acetate-hexane). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.17 (1H, t, J = 7.7 Hz), 6.86-6.81 (3H, m), 5.17 (2H, s), 3.48 (3H, s), 2.33 (3H, s). MS (H_2O-GC/MS): *m/e* 153 (60), 121 (100).

Part B. A solution of 3-(methoxymethoxy)toluene (5.00 g, 32.9 mmol) and TMEDA (5.30 mL, 35.1 mmol) in THF (50 mL) was cooled to 0 °C, and treated with a hexane solution of n-butyllithium (22.0 mL, 1.6 M, 35.2 mmol). After 4 hours, the solution was cooled to -78 °C, and treated dropwise with ethylene oxide (2.00 mL, 40 mmol, condensed from a lecture bottle through a cold-finger into a graduated dropping funnel). The mixture was allowed to stir and warm to ambient temperature overnight,

then was poured into satd. aq. ammonium chloride solution (120 mL). This was extracted with ethyl acetate (2 x 120 mL), and the extracts were washed in sequence with brine, combined, dried over magnesium sulfate, filtered and evaporated. The residual oil was separated by column chromatography (10:90 ethyl acetate-hexane) to afford the desired product, 2-[2-(methoxymethoxy)-4-methylphenyl]ethanol, as a viscous liquid (2.25 g, 11.5 mmol, 35%), along with 2.50 g recovered starting material. The ^{1}H NMR spectrum showed regioselectivity in excess of 10:1. TLC R_F 0.09 (10:90 ethyl acetate-hexane). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.06 (1H, d, J = 7.7 Hz), 6.92 (1H, br s), 6.78 (1H, br d, J = 7.7 Hz), 5.20 (2H, s), 3.83 (2H, q, J = 6.4 Hz), 3.49 (3H, s), 2.89 (2H, t, J = 6.6 Hz), 2.32 (3H, s), 1.61 (1H, t, J = 5.9 Hz). MS (NH_3-DCI): *m/e* 214 (76), 212 (100), 197 (9), 182 (30), 165 (38).

Part C. A solution of the MOM compound from Part B (1.84 g, 9.38 mmol) was dissolved in 1:1 THF-isopropanol (20 mL), and treated with HCl in dioxane (2.5 mL, 4 N, 10.0 mmol). Part D. A solution of the diol from Part C (ca. 9 mmol) and triphenylphosphine (2.83 g, 10.8 mmol) in THF (20 mL) was cooled to 0 °C, and treated with diethyl azodicarboxylate (1.70 mL, 10.8 mmol) by syringe. The solution was stirred overnight, then evaporated, and the residue separated by a flash column to afford the product, 6-methyl-2,3-dihydrobenzofuran (780 mg, 5.81 mmol, 65%). TLC R_F 0.29 (2:98 ethyl acetate-hexane). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.07 (1H, d, J = 7.4 Hz), 6.66 (1H, d, J = 7.4 Hz), 6.62 (1H, s), 4.54 (2H, t, J = 8.6 Hz), 3.16 (2H, t, J = 8.6 Hz), 2.30 (3H, s). MS (D_2O-GC/MS): *m/e* 135 (100).

Part E. A solution of the above compound (780 mg) and N-bromosuccinimide (1.24 g, 6.97 mmol) in dichloroethane (10 mL) was heated to reflux overnight, then cooled, filtered and

evaporated. Column chromatography (hexane, then 2:98 ethyl acetate-hexane) gave first 5-bromo-6-methylbenzofuran (270 mg, 1.27 mmol, 22%), then 5-bromo-6-methyl-2,3-dihydrobenzofuran (923 mg, 4.33 mol, 75%), both as solids. For the dihydro product: TLC R_F 0.35 (2:98 ethyl acetate-hexane). ^{1}H NMR (300 MHz, $CDCl_3$): d 7.31 (1H, s), 6.68 (1H, s), 4.56 (2H, t, J = 8.8 Hz), 3.17 (2H, t, J = 8.8 Hz), 2.33 (3H, s). MS (H_2O-GC/MS): *m/e* 215 (76), 213 (100).

Part F. A solution of the bromide from Part E (923 mg, 4.33 mmol) in tetrahydrofuran (20 mL) was cooled to -78 °C, and treated with a hexane solution of n-butyllithium (3.0 mL, 1.6 M, 4.8 mmol). After 1 hour, the reaction mixture was treated with triisopropylborate (1.00 mL, 4.33 mmol) and allowed to come to ambient temperature over 6 hrs. Then, 1 mL of 6 N aq. HCl and 3 mL water were added, and the resulting mixture was allowed to stir for 1 hr. It was poured into water (100 mL), and extracted with ethyl acetate (2 x 100 mL). The extracts were washed with brine (60 mL), combined, dried over sodium sulfate, filtered and evaporated to afford a solid, which was purified by trituration with hexane to give 6-methyl-2,3-dihydrobenzofuran-5-boronic acid (718 mg, 4.03 mmol, 93%).

Part G. A mixture of the boronic acid from Part F (298 mg, 1.67 mmol), 6-chloro-9-dicyclopropylmethyl-8-ethylpurine (309 mg, 1.12 mmol), 2 N aqueous sodium carbonate solution (1.7 mL, 3.4 mmol) and triphenylphosphine (61 mg, 0.233 mmol) in DME (20 mL) was degassed by repeated cycles of brief vacuum pumping followed by nitrogen purging. To this was added palladium (II) acetate (13 mg, 0.058 mmol), and the mixture was degassed again and then heated to reflux for 14 hours. It was cooled, and poured into water (100 mL). The methods used in the preparation of the compounds of Table 1 may be used for the compounds of Structure A of Table 6. For example, replacing variously-substituted pentaatomic heteroaryl boronic acids for benzeneboronic acids in the palladium-catalyzed aryl cross-coupling method (see Examples 35 or 831) will afford the desired 6-heteroarylpurine compounds.

The methods of Schemes 13 and 14 may be used to prepare many of the examples of Structure B and Structure C contained in Table 6, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

a) Where the compound is indicated as an 'oil', spectral data is provided as follows:

Example 6001 spectral data: MS (NH_3-CI): m/e 338 (M+H^+, 100%).

The methods used in the preparation of the compounds of Table 1 may be used for preparation of many of the compounds of Structure A of Table 7. The preparation of those compounds derived from cycloaddition of compounds with alkynyl-bearing R^1 groups is illustrated by the following examples.

The methods of Schemes 13 and 14 may be used to prepare many of the examples of Structure B and Structure C contained in Table 7, with minor procedural modifications where necessary and use of reagents of the appropriate structure.

Example 7409

Preparation of 9-[1-cyclopropyl-1-(3-methyl-isoxazol-5-yl)methyl]-6-(2,4-dichlorophenyl)-8-ethyl-9*H*-purine

To a stirring solution of the compound of Example 7241 (90 mg, 0.24 mmol; prepared in a manner similar to that of Example 2 using 6-(2,4-dichlorophenyl)-8-ethyl-9*H*-purine and 3-cyclopropyl-1-propyn-3-ol) in methylene chloride (2 mL) were added chloroacetaldoxime (25 mg, 0.27 mmol) and triethylamine (0.038 mL, 0.27 mmol). (The chloroacetaldoxime used was previously prepared by reacting equimolar amounts of acetaldoxime and N-chlorosuccinimide in DMF, then extracting the product into diethyl ether and washing with water.) The cycloaddition reaction was monitored by TLC and additional amounts of chloroacetaldoxime and triethylamine were added

until all the starting material was consumed. The reaction mixture was purified by adding directly to a column packed with silica gel and eluting using a gradient of 100% hexane to 25% ethyl acetate in hexane. 72 mg of a white foam was collected. MS (NH_3-CI) 428 ($M+H^+$). HRMS: m/e = 428.1037 ($M+H^+$, $C_{21}H_{20}Cl_2N_5O$). Purity by reverse phase HPLC >97%.

<u>Examples 7396 and 7398</u>

<u>Preparation of 6-(2,4-dichlorophenyl)-9-[1-(3-ethoxycarbonyl-isoxazol-5-yl)butyl]-8-ethyl-9*H*-purine and 9-[1-(4-cyano-3-ethoxycarbonyl-isoxazol-5-yl)butyl]-6-(2,4-dichlorophenyl)-8-ethyl-9*H*-purine</u>

A solution of the compound of Example 7259 (120 mg, 0.321 mmol; prepared prepared in a manner similar to that of Example 2 using 6-(2,4-dichlorophenyl)-8-ethyl-9*H*-purine and 1-hexyn-3-ol), ethyl chlorooximidoacetate (146 mg, 0.963 mmol) and diisopropylethylamine (170 µL, 0.976 mmol) in toluene (2 mL) was heated to reflux for 20 hours, then cooled and diluted with 20 mL ethyl acetate. This was washed with water (2 x 20 mL) and satd. aq. brine (20 mL), and the aqueous phases were back-extracted in sequence with ethyl acetate (20 mL). The organic extracts were combined, dried over anhydrous sodium sulfate, filtered and evaporated. The residual material was separated by column chromatography (silica gel, 1:4 ethyl acetate-hexane) to afford, in order, unreacted starting material (about 50 mg), then the compound of Example 7396 (58.7 mg, 0.120 mmol, 37%), and finally the compound of Example 7398 (23.8 mg, 0.046 mmol, 14%), the latter two compounds being amorphous solids. Example 7396 spectral data: TLC R_F 0.27 (20:80 ethyl acetate-hexane). ^1H NMR (300 MHz, $CDCl_3$): δ 8.96 (1H, s), 7.67 (1H, d, J = 8.1 Hz), 7.58 (1H, d, J = 1.8 Hz), 7.41 (1H, dd, J = 8.1, 1.8 Hz), 6.86 (1H, s), 5.83 (1H, dd, J = 9.9, 6.2 Hz), 4.43 (2H, q, J = 7.3 Hz), 2.98 (2H, q, J = 7.7 Hz), 2.91-2.78 (1H, m), 2.63-2.49 (1H, m), 1.42 (3H, t, J = 7.7 Hz), 1.40 (3H, t, J = 7.3 Hz), 1.39-1.19 (2H, m), 1.00 (3H, t, J = 7.3 Hz). Utility

CRF-R1 Receptor Binding Assay for the Evaluation of Biological Activity

The following is a description of the isolation of cell membranes containing cloned human CRF-R1 receptors for use in the standard binding assay as well as a description of the assay itself.

Messenger RNA was isolated from human hippocampus. The mRNA was reverse transcribed using oligo (dt) 12-18 and the coding region was amplified by PCR from start to stop codons The resulting PCR fragment was cloned into the EcoRV site of pGEMV, from whence the insert was reclaimed using XhoI + XbaI and cloned into the XhoI + XbaI sites of vector pm3ar (which contains a CMV promoter, the SV40 't' splice and early poly A signals, an Epstein-Barr viral origin of replication, and a hygromycin selectable marker). The resulting expression vector, called phchCRFR was transfected in 293EBNA cells and cells retaining the episome were selected in the presence of 400 mM hygromycin. Cells surviving 4 weeks of selection in hygromycin were pooled, adapted to growth in suspension and used to generate membranes for the binding assay described below. Individual aliquots containing approximately 1×10^8 of the suspended cells were then centrifuged to form a pellet and frozen.

For the binding assay a frozen pellet described above containing 293EBNA cells transfected with hCRFR1 receptors is homogenized in 10 mL of ice cold tissue buffer (50 mM HEPES buffer pH 7.0, containing 10 mM $MgCl_2$, 2 mM EGTA, 1 mg/L

aprotinin, 1 mg/mL leupeptin and 1 mg/mL pepstatin). The homogenate is centrifuged at 40,000 x g for 12 min and the resulting pellet rehomogenized in 10 mL of tissue buffer. After another centrifugation at 40,000 x g for 12 min, the pellet is resuspended to a protein concentration of 360 mg/mL to be used in the assay.

Binding assays are performed in 96 well plates; each well having a 300 mL capacity. To each well is added 50 mL of test drug dilutions (final concentration of drugs range from 10^{-10} to 10^{-5} M), 100 mL of ^{125}I-ovine-CRF (^{125}I-o-CRF) (final concentration 150 pM) and 150 mL of the cell homogenate described above. Plates are then allowed to incubate at room temperature for 2 hours before filtering the incubate over GF/F filters (presoaked with 0.3% polyethyleneimine) using an appropriate cell harvester. Filters are rinsed 2 times with ice cold assay buffer before removing individual filters and assessing them for radioactivity on a gamma counter.

Curves of the inhibition of ^{125}I-o-CRF binding to cell membranes at various dilutions of test drug are analyzed by the iterative curve fitting program LIGAND [P.J. Munson and D. Rodbard, *Anal. Biochem.* 107:220 (**1980**), which provides K_i values for inhibition which are then used to assess biological activity.

Alternatively, tissues and cells which naturally express CRF receptors can be employed in binding assays analogous to those described above.

A compound is considered to be active if it has a K_i value of less than about 10000 nM for the inhibition of CRF.

Inhibition of CRF-Stimulated Adenylate Cyclase Activity

Inhibition of CRF-stimulated adenylate cyclase activity can be performed as described by G. Battaglia et al. *Synapse* **1**:572 (**1987**). Briefly, assays are carried out at 37 °C for 10 min in 200 mL of buffer containing 100 mM Tris-HCl (pH 7.4 at 37 °C), 10 mM $MgCl_2$, 0.4 mM EGTA, 0.1% BSA, 1 mM isobutylmethylxanthine (IBMX), 250 units/mL phosphocreatine kinase, 5 mM creatine phosphate, 100 mM

guanosine 5'-triphosphate, 100 nM oCRF, antagonist peptides (concentration range 10^{-9} to 10^{-6} M) and 0.8 mg original wet weight tissue (approximately 40-60 mg protein). Reactions are initiated by the addition of 1 mM ATP/^{32}P]ATP (approximately 2-4 mCi/tube) and terminated by the addition of 100 mL of 50 mM Tris-HCL, 45 mM ATP and 2% sodium dodecyl sulfate. In order to monitor the recovery of cAMP, 1 mL of [^{3}H]cAMP (approximately 40,000 dpm) is added to each tube prior to separation. The separation of [^{32}P]cAMP from [^{32}P]ATP is performed by sequential elution over Dowex and alumina columns.

In vivo Biological Assay

The *in vivo* activity of the compounds of the present invention can be assessed using any one of the biological assays available and accepted within the art. Illustrative of these tests include the Acoustic Startle Assay, the Stair Climbing Test, and the Chronic Administration Assay. These and other models useful for the testing of compounds of the present invention have been outlined in C.W. Berridge and A.J. Dunn *Brain Research Reviews* 15:71 **(1990)**. Compounds may be tested in any species of rodent or small mammal.

Compounds of this invention have utility in the treatment of inbalances associated with abnormal levels of corticotropin releasing factor in patients suffering from depression, affective disorders, and/or anxiety.

Compounds of this invention can be administered to treat these abnormalities by means that produce contact of the active agent with the agent's site of action in the body of a mammal. The compounds can be administered by any conventional means available for use in conjunction with pharmaceuticals either as individual therapeutic agent or in combination of therapeutic agents. They can be administered alone, but will generally be administered with a pharmaceutical carrier selected on the basis of the

chosen route of administration and standard pharmaceutical practice.

The dosage administered will vary depending on the use and known factors such as pharmacodynamic character of the particular agent, and its mode and route of administration; the recipient's age, weight, and health; nature and extent of symptoms; kind of concurrent treatment; frequency of treatment; and desired effect. For use in the treatment of said diseases or conditions, the compounds of this invention can be orally administered daily at a dosage of the active ingredient of 0.002 to 200 mg/kg of body weight. Ordinarily, a dose of 0.01 to 10 mg/kg in divided doses one to four times a day, or in sustained release formulation will be effective in obtaining the desired pharmacological effect.

Dosage forms (compositions) suitable for administration contain from about 1 mg to about 100 mg of active ingredient per unit. In these pharmaceutical compositions, the active ingredient will ordinarily be present in an amount of about 0.5 to 95% by weight based on the total weight of the composition.

The active ingredient can be administered orally is solid dosage forms, such as capsules, tablets and powders; or in liquid forms such as elixirs, syrups, and/or suspensions. The compounds of this invention can also be administered parenterally in sterile liquid dose formulations.

Gelatin capsules can be used to contain the active ingredient and a suitable carrier such as but not limited to lactose, starch, magnesium stearate, steric acid, or cellulose derivatives. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of time. Compressed tablets can be sugar-coated or film-coated to mask any unpleasant taste, or used to protect the active ingredients from the atmosphere, or to allow selective disintegration of the tablet in the gastrointestinal tract.

Liquid dose forms for oral administration can contain coloring or flavoring agents to increase patient acceptance.

In general, water, pharmaceutically acceptable oils, saline, aqueous dextrose (glucose), and related sugar solutions and glycols, such as propylene glycol or polyethylene glycol, are suitable carriers for parenteral solutions. Solutions for parenteral administration preferably contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, butter substances. Antioxidizing agents, such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or in combination, are suitable stabilizing agents. Also used are citric acid and its salts, and EDTA. In addition, parenteral solutions can contain preservatives such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol.

Suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences", A. Osol, a standard reference in the field.

Useful pharmaceutical dosage-forms for administration of the compounds of this invention can be illustrated as follows:

<u>Capsules</u>

A large number of units capsules are prepared by filling standard two-piece hard gelatin capsules each with 100 mg of powdered active ingredient, 150 mg lactose, 50 mg cellulose, and 6 mg magnesium stearate.

<u>Soft Gelatin Capsules</u>

A mixture of active ingredient in a digestible oil such as soybean, cottonseed oil, or olive oil is prepared and injected by means of a positive displacement was pumped into gelatin to form soft gelatin capsules containing 100 mg of the active ingredient. The capsules were washed and dried.

Tablets

A large number of tablets are prepared by conventional procedures so that the dosage unit was 100 mg active ingredient, 0.2 mg of colloidal silicon dioxide, 5 mg of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch, and 98.8 mg lactose. Appropriate coatings may be applied to increase palatability or delayed adsorption.

The compounds of this invention may also be used as reagents or standards in the biochemical study of neurological function, dysfunction, and disease.

Although the present invention has been described and exemplified in terms of certain preferred embodiments, other embodiments will be apparent to those skilled in the art. The invention is, therefore, not limited to the particular embodiments described and exemplified, but is capable of modification or variation without departing from the spirit of the invention, the full scope of which is delineated by the appended claims.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 98/13913

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.: 6
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim 6 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. [ ] Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. [ ] Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.
